MW Realty
Project & Workflow Overview

What the product is, who uses it, and how the public website, Admin and CRM work together

MW Realty is a real-estate marketplace connected to a partner CRM and a platform administration system. People search residential and commercial listings on the public website. Agencies and agents manage their listings and enquiries in the CRM. The Admin team manages the marketplace, partner accounts, approvals, plans and platform-wide operations.

The three main work areas

1. Public website
Property discovery, agency/agent profiles, market content, customer tools and enquiry capture.

2. Admin / CMS
Site content and configuration, partner onboarding and review, platform plans, and global operations.

3. Partner CRM
Agency and agent dashboard for leads, listings, team, account plan, integrations and support.

Shared platform services
Laravel application and APIs, database, visitor activity tracking, notifications, media and payment/provider connections.

Who uses it

Public visitor / buyer searches and sends enquiries

Customer account saves listings and searches

Agent handles personal/assigned work

Agency manages team and inventory

Super Admin operates the marketplace

CMS staff manage areas by permission

> **In one sentence:** MW Realty is a multi-account property listing and lead platform, where website activity becomes trackable enquiries that can be worked by the right agency or agent.

This overview follows the screens, routes and workflows in the project. Menu visibility and actions can vary by role, KYC approval and plan.

1. Public website: discovery to enquiry

The public-facing marketplace lets visitors browse residential and commercial properties, search/filter results, view listing details and explore agencies, agents and editorial content.

Find a property
Search/filter listings, view details, photos, location, features, floor plans and nearby places where supplied.

Explore the marketplace
Browse agency and agent profiles, commercial listings, market insights, blogs, calculators and other site content.

Use a customer account
Register/sign in, manage account settings, save favorites and saved searches.

Contact the business
Submit an enquiry, viewing request, brochure/floor-plan request, profile request, contact form or chatbot conversation.

What happens to visitor activity

1. Public pages read published listing and site content through the application API.
2. Visitor actions can create a lead or capture identity. Page visits, listing views, clicks and time on page can be recorded as activity.
3. Enquiries connected to a listing are associated with its owner and, where assigned, agent. Certain enquiry types may create a CRM lead directly.
4. Identified website visitors and activity are also available to Super Admin in Website Leads, including the unassigned Lead Pool.
5. Agencies and agents see and work CRM leads they are permitted to access. Assignment can be manual or round-robin.

Tester focus: check both sides of a submission: the visitor gets a clear response, and the correct lead/activity appears in the appropriate Admin or CRM view.

2. Admin / CMS: operating the marketplace

The Admin area is the operational control room. Staff sign in to the CMS and see tools allowed by their role and permissions. Super Admin has platform-wide access to designated global workflows.

Website content and configuration

CMS screens manage home-page sections and headings, banners, blogs and categories, landing pages, FAQs, testimonials, site information, translations, market insights/trends, location/community content, search filters and property option lists. Published changes feed the public website.

Partner and marketplace operations

- **Partner onboarding:** review agency/agent applications, profile details and KYC documents; approve, reject or request changes. Approval unlocks restricted CRM work.
- **Plans and billing setup:** maintain plan definitions, feature entitlements, coupons and payment records. The account's plan controls limits and gated tools.
- **Listing compliance:** review permit information and approve or take down eligible listings. Permit/compliance status can affect public visibility.
- **Global leads:** inspect Website Leads from forms, AI chat, customer activity and other sources; review visitor insight and transfer pool leads to an agency/agent.
- **Advertisements:** define placements and review, approve, reject or take down client ads; public views/clicks feed performance metrics.
- **Support and setup:** manage help content, roles/permissions and configured operational data according to CMS permissions.

Typical Admin scenarios

> **Approve a partner:** application arrives → staff inspect profile/documents → approve or request corrections → approved partner accesses eligible CRM tools.

> **Review a listing:** partner submits listing/permit → compliance review → approve or take action → listing becomes available or stays restricted.

> **Route a website lead:** visitor is identified → record enters Website Leads pool → Super Admin reviews activity → transfers to a partner → partner follows up in Leads.

The CMS is permission-based. A missing menu can reflect role permissions or workflow limitations.

3. CRM: partner workbench

The CRM is used by agency and agent accounts to manage daily property business. It is a Vue single-page application backed by Laravel CRM APIs. Navigation is generated for the signed-in account and can show locks or badges.

Dashboard and insights
Overview of leads, pipeline, follow-up needs, listings, performance and reports.

Leads and Master
Search/update enquiries, notes, stages, tags, sources, assignment, imports and exports.

Listings
Create residential/commercial listings, edit content/media, check performance, manage premium and sold/rented records.

Team and tools
Manage agents and assignment, nearby places, watermark, ads and provider integrations.

Account
Profile/KYC, two-factor security, plans, payment history, credits and support tickets.

Role limits
Agency users manage their team; agents have scoped access; Super Admin sees global views where available.

Rules that shape CRM behavior

- **Account scope:** normal users see their agency/agent data and permitted shared data; global views are explicitly marked.
- **KYC/approval:** leads, reports and listing work can be locked until approval. Profile/security/support remain available for onboarding.
- **Plan entitlement:** Lead Insights, Reports, Integrations, watermark settings, ads, listing limits and Premium quotas can depend on plan or credits.
- **Lead routing:** leads can go to the listing agent, agency, or manual/round-robin allocation based on configuration.
- **Public publishing:** saved CRM data does not always mean a listing is live; status, permit/compliance, plan and approval rules can apply.

> **When testing:** record account role, agency, KYC state and plan. Those determine which menus, actions and sample data should be visible.

4. End-to-end product scenarios

A. Partner onboarding and first listing

> Agency/agent registers and verifies account → completes profile and documents → Admin reviews KYC → partner is approved → plan is selected or assigned → user creates a listing → permit/compliance checks run → eligible listing can appear publicly.

B. Buyer enquiry to agent follow-up

> Visitor searches marketplace → opens listing and sends enquiry/viewing request → system records lead and activity → lead routes to listing owner/agent or stays unassigned → CRM user updates notes/stage/tags and follows up → dashboard/reporting reflects activity.

C. Website lead transfer

> Visitor identifies through form/chat/account → Super Admin reviews Website Leads and tracked interests → selects destination and transfers → partner receives CRM lead → lead is managed in Leads.

D. Integration and advertising

> Partner connects an eligible provider (Facebook Lead Ads or Property Finder) → provider data/listing sync reaches integration workflow → CRM displays status. Separately, partner books website ad → Admin reviews → public ad receives impression/click tracking.

System boundaries

Frontend is what visitors see. **Admin/CMS** controls content, accounts and global operations. **CRM** is where partners manage listings, leads and their account. The **Laravel backend and database** validate requests, enforce account/role/plan rules and store records. External services communicate through integrations/webhooks when configured.

Useful issue report

Module/page • test role/account and plan • sample record reference • steps taken • expected and actual result • screenshot/recording • whether it repeats after refresh.

> **Project identity:** MW Realty is a property marketplace and partner operations platform combining public discovery, lead capture/tracking, agency/agent CRM and a permission-controlled Admin CMS.

5. Languages, frameworks and versions

This page lists the main technologies visible in the project manifests and lock files. Version ranges are requirements; locked versions are the exact dependency versions resolved for this checkout.

Area	Technology	Version in this project	Role
Backend language	PHP	Requires **^8.5** (8.5 or compatible 8.x release)	Server-side business logic, APIs and admin/CRM routes
Backend framework	Laravel	Requires **^13.0**; lock file **v13.38.0**	Routing, auth, database, validation, services and API
Frontend language	JavaScript (ES modules)	ES module project	Public site and interactive CRM behavior
Frontend framework	Vue	Requires ^3.5.42; lock file **3.5.42**	Public and CRM interactive interfaces
CRM navigation	Vue Router	Requires ^4.6.4; lock file **4.6.4**	CRM single-page navigation
Templates	Blade / HTML	Laravel Blade	Server-rendered CMS/admin and page shell/templates
Styles	CSS + Tailwind CSS	Tailwind ^4.0.0; lock file **4.3.3**	Website and CRM visual styling
Frontend build	Vite	Requires ^7.0.7; lock file **7.3.6**	Development server and asset build
Vue build plugin	@vitejs/plugin-vue	Locked **6.0.8**	Compiles Vue single-file components
Laravel build plugin	laravel-vite-plugin	Requires ^2.0.0; lock file **2.1.0**	Connects Laravel asset entry points to Vite
Database	SQLite / MySQL supported	Driver selected by `DB_CONNECTION`; config default is SQLite	Application data; deployment environment chooses active database
Payments	Stripe PHP SDK	Requires ^21.3	Subscription and payment integration

> **Runtime note:** The repository does not pin a specific Node.js or npm version. Node/npm are needed for Vite asset commands (`npm run dev` / `npm run build`); use a Node release compatible with the locked Vite 7 dependency. Production PHP, database, credentials and external integrations are configured per environment.

Version sources: composer.json / composer.lock and package.json / package-lock.json. “Requires” indicates the allowed dependency range; “lock file” is the resolved version in this project checkout.
