Leads

End-to-end checks for lead capture, routing, follow-up and list management

Access: Super Admin enters CRM from the admin end and sees global leads. Agency and Agent users sign in through the frontend portal and see permitted account data only. Use approved test accounts and disposable contacts.

What this module does

Leads brings website enquiries, Facebook leads, imports and manual entries into one workflow. Records can include source, stage, tags, property, owner/agent assignment, notes and activity history.

Lead source and routing tests

Scenario	Tester workflow	Expected result
Property detail enquiry	Submit a test enquiry on a listing with known agency/agent; use unique test contact details. Open the CRM lead.	Lead shows property and website/property enquiry source, contact/message and correct listing owner. It routes to eligible property agent or follows that agency assignment setting.
Facebook Lead Ads	Use connected test Page if configured, or Import > Facebook leads with a Meta Leads Center/Ads Manager CSV.	Facebook source/channel is visible. Campaign/ad set/ad/form attribution is retained when provided. Assignment follows enabled Facebook setting.
Manual entry	Choose Add Lead; enter test name/contact/message and set stage, source, tags and owner where offered; save.	Record appears once in correct scope with chosen values retained on reopening.
No direct assignee	Use a test lead whose source/agency is manual or has no eligible agent; inspect owner, agent and history.	Lead remains visible and unassigned at the proper account level for later handling.

Routing: Listing enquiries follow listing ownership and eligible property-agent relationships. Agency automatic assignment applies only for configured lead types/sources. Direct eligible property-agent routing may take precedence.

Tester workflow - create and inspect

1. Check scope using Super Admin, Agency and Agent test accounts separately.
2. Create one disposable lead from each available source: property enquiry, Facebook and manual entry.
3. Open each lead and verify contact, source/channel, property, stage, tags, owner/agent and received date.
4. Open Profile, Timeline, Summary and Insights when available. Return to list and confirm the record still appears.

Manage and find leads

Filters, table fields, detail page and assignment

List controls workflow

1. Search a known test lead by name/email/phone. Filter by stage, source, tag and received date. Check owner filter for Super Admin and agent/unassigned filter for agency.
2. Try quick filters (Total, Active 24h, Last 7 days, Website Insights), then clear filters and verify the list resets.
3. Sort, paginate and change page size; confirm rows/counts are consistent.
4. Open Table Fields, show/hide columns and save; reload. Drag a supported column to reorder, then reload again.
5. Select a disposable lead, use Assign Stage / Assign Tag, reopen it and check values persisted. Use valid Master values.

Round-robin workflow and availability

1. In a test agency, open Lead Assignment. Confirm Automatic mode and enable the source type being tested (Property, Facebook or Generic).
2. With multiple eligible active agents, create several disposable leads of that source. Check each lead's assigned agent and assignment history.
3. Confirm new leads rotate through eligible agents. Agents who are pending, inactive, suspended or have left the agency are not eligible.
4. Repeat with no eligible available agents (test agency with zero active eligible agents). Create another lead of an enabled source and inspect it.

No available agents - expected: Round-robin cannot assign the lead. It remains unassigned at the agency level, stays visible for manual handling, and is not sent to an inactive or unrelated agent. No lead should be lost and no assignment error should block capture.

5. Restore an eligible agent and create another lead. Confirm rotation resumes. Existing unassigned leads need the explicit Distribute unassigned action if they are to be assigned in bulk.

If Manual mode is selected or the source is not enabled, round-robin does not run; the lead awaits manual handling, subject to direct property-agent routing.

Detail page checks

Review/edit permitted profile fields, contacts, stage, source, tags, owner/agent assignment, property, notes and timeline. Add a test note and reopen. Verify assignment history. Summary activity counts should match displayed notes/timeline/enquiries. Website Insights can show website views, time, searches, favourites or chats; non-website leads may have no insights.

Expected results

- [ ] Filters show matching rows; clearing them restores the prior list.
- [ ] Column visibility/order persists for the signed-in user.
- [ ] Stage, tags and assignment persist and agree between list and detail.
- [ ] No eligible agents means agency-level unassigned; rotation resumes when eligible agents return.
- [ ] Detail tabs load and new notes/history are visible after refresh.

Bulk actions and files

Use disposable test records and confirm the target selection

Import

1. Download the correct template. Use Direct import for MW Realty template/export; keep required columns. Choose Facebook leads for Meta CSV.
2. Import a small test file with valid, duplicate and invalid rows. Wait for progress/notification if processing runs in the background.
3. Review Import Status: added, updated, skipped/rejected reasons. Verify attribution, account scope and assignments on imported leads.

Export

1. Select one or more disposable leads and Export. Check the spreadsheet contains the selected rows and readable headings/values.
2. Filter the list, select all matching using the header checkbox, including results across pages, then export. Verify row count matches all filtered results rather than only the visible page.

Select all and bulk action

Use header checkbox to select all filter-matching leads across pages. Verify selected count, apply a stage/tag action, and confirm only intended rows changed. Uncheck to clear. For manual row selection, check the partial-selection indicator and confirm only checked rows are affected.

Delete and restore

1. Select a disposable test lead, choose Delete Leads and confirm. If authorized, also check single-lead delete from detail.
2. Confirm it disappears from active results and is listed under View deleted leads.
3. Restore it and confirm it returns to active results with details/history intact.
4. Permanent delete is irreversible: use only a dedicated disposable record and only when specifically in scope.

Expected results

- [ ] Import reports row outcomes clearly and does not silently omit failures.
- [ ] Export contains selected or all matching rows as requested.
- [ ] Bulk actions affect only selected records; select-all count covers all matching pages.
- [ ] Soft deletion is reversible; restored lead is active again.

Test notes and bug report

Use test-only contact data. Record role, account, source, assignment mode, lead ID, exact steps, expected vs actual result, timestamp and screenshot. Mask personal data. Do not run bulk actions or permanent deletion against real contacts.
