Lead Insights

Create a website lead and verify its browsing and engagement activity

Where to test: CRM > Leads > open the lead > Insights tab. The separate Lead Insights menu is an overview list for finding and comparing tracked leads. Use an approved test account with the Lead Insights plan feature enabled.

What this module means

Lead Insights connects a CRM lead to activity tracked on the public website or customer account: pages and properties viewed, filtered searches, saved items, AI chats and website enquiries. It is engagement context, not a guarantee of intent or a replacement for checking the lead record.

How to create a lead and test activity

1. Use an approved test account and a unique test name, email and phone. Open the public website in a fresh browser session. Note the exact email/contact to use so you can find the resulting CRM lead.
2. **Create the lead from the website.** Either open a property detail page and submit its Enquiry/Contact Agent form, or start the AI chat and provide your test name/contact when it asks for details. Complete submission and note the confirmation.
3. Sign in with the matching test customer account if available. Continue in the same browser/session after submitting the form or identifying yourself in chat; this lets tracked visitor activity associate with the lead just created.
4. Browse several property detail pages and spend time on them. Run filtered searches (location/type/price/bedrooms), save a search, favorite a listing, and exchange messages with the AI assistant.
5. In CRM Leads, search by the unique test email/name. Open the matching new lead, verify property/source/contact, then click Insights. Refresh after tracking has had time to save.

Important identity rule: Do not switch browser, email or customer account during the scenario. If the enquiry form/chat was completed in a different session or with different details, activity may be stored against another visitor/lead and not appear on this record.

Summary cards - meaning

Card	Meaning
Time on site / pages	Total tracked site time and pages viewed.
Property views	Listing detail views; subtext shows distinct listings and property-page time.
Searches	Filtered searches; saved-search count shown separately.
Favorites	Properties saved as favorites; typically requires customer sign-in.
AI chats	Chat conversations and total messages.
Form enquiries	Website enquiry form submissions tracked for the visitor.

Read and verify the activity

Panel	Meaning / tester check
Engagement, first seen, last active	Engagement label summarizes tracked views, time, chats, enquiries and saves; it is not a CRM stage. First seen/last active are visitor activity timestamps. Compare with your scenario timing.
Came in via	Website capture/entry context (such as enquiry form or AI chat). Compare with CRM source/channel; the terms describe related but distinct information.
Most Interested Properties	Ranked listings by time spent, with views, last-viewed time and listing owner. Open listings repeatedly and check expected ranking/counts.
Activity Timeline	Newest-first tracked events. Key events is a subset; All activity adds ordinary page views. Switch filter, scroll, and compare event labels, listing links and times.
AI Chat History	Conversations and message count. Expand a conversation to load messages; check user/bot messages and suggested properties from the test chat.
What They Search For	Search criteria summarized as chips (for example location/price); run filtered searches and verify criteria/repeated count.
Saved by Lead	Favorites lists saved properties; Searches lists saved queries and criteria. These require saved actions and a signed-in matching customer account.

Detail verification workflow

1. Confirm lead ID and contact match your website submission/chat before reviewing insights.
2. Record card values, perform one controlled action on the site, reload and check the related count/detail.
3. Check property ranking, timeline (Key events and All activity), chat messages, search chips and saved items.
4. Scroll long lists and chat history to check more items load. Open a second lead and verify its activity is separate.

Expected results

- [ ] The enquiry/chat creates a CRM lead with the supplied test contact; it is searchable in Leads.
- [ ] Activity performed afterward in the same identified session is associated with that lead.
- [ ] Relevant cards/details update and match the actions; unrelated lead activity is not mixed.
- [ ] Timeline filters and scrolling load activity without errors or duplicates.

Access, list and troubleshooting

Lead Insights overview menu

Open CRM Lead Insights to find and compare tracked visitor leads. Search a known name/email/phone, test available sorts (recent activity, time, property views, chats), compare a row with its detail Insights tab, clear search and test pagination. Confirm user scope: Agency/Agent see permitted accounts; Super Admin sees global data.

Why data can be empty

State	Meaning / what to try
Plan lock	Lead Insights feature may be unavailable for account/plan. Record role/account/plan; enable access before reporting missing analytics.
No website activity for this lead	Manual/Facebook/imported lead may have no tracked visitor history, or form/chat used a different identity/session. Create a website lead with the same test session/contact as on page 1.
Zero views, searches or chats	No matching action has been tracked, or the event has not saved yet. Perform one action, allow a short interval, refresh.
Empty favorites/searches	Save a favorite/search while signed into the matching customer account.
Key events empty but All activity has rows	Normal when only ordinary page views were tracked; All activity includes page views.
Load/API error	Capture role, account, lead ID, source, time, exact actions and screenshot; check whether other leads/sections work.

Expected results checklist

- [ ] Overview search/sorting/pagination and role scope work.
- [ ] Summary cards, labels and detail data belong to selected lead only.
- [ ] Empty states explain missing activity; no broken chart/page error.
- [ ] Timeline and chat feeds load more on scroll.
- [ ] Refresh/navigation does not mix, duplicate or erase events.

Test notes / bug report

Record role, account/plan, lead ID, exact contact/session used, website form or chat used to create lead, actions and timestamps, section, expected vs actual and screenshot. Use test data only and mask personal information.

> **Reminder:** A form submission or AI chat can create the lead; subsequent browsing activity appears when the visitor identity is linked to that lead. A generic/manual or imported lead does not automatically have browsing history.
