Website Leads

Super Admin pool, visitor interest and automatic account routing

Access: Super Admin only. Agency and Agent users must not access this workspace. Website Leads tracks identified people who submit general website forms or identify themselves in AI chat/customer account. It is separate from a partner CRM Leads list.

Two website enquiry paths

Visitor action	What should happen
Enquiry/Contact Agent form on a specific property detail page	The enquiry is connected to that listing and goes directly to the listing's agency/agent CRM account. Check it in that account's CRM Leads; it is not expected to wait in the general Website Leads pool.
AI chat from a property detail page	When the visitor provides contact details, the AI chat creates/identifies the website lead. Listing context and later tracked property interest determine routing. Test the associated activity and destination against the listing/agent/agency rules below.
Home page form, Contact Us, general enquiry/other non-listing form, or AI chat without a direct listing enquiry	Identified lead initially appears in the Super Admin Website Leads Pool. Super Admin can monitor activity and manually transfer; qualifying repeated listing interest automatically routes it to the related account.

Automatic routing rule

A pool lead with contact identity and tracked property views is automatically routed after **two qualifying visits** to any one of these interest groups:

1. The same property listing is visited twice.
2. Listings belonging to the same agent are visited twice in total.
3. Listings belonging to the same agency are visited twice in total.

Counting rule: Repeat opens/refreshes of the same listing within 30 minutes count as one visit (prevents refresh/back-button noise). Use visits separated by at least 30 minutes for a reliable repeat-view test. When routed, the listing's normal assignment chooses the agent; the lead moves to that account and is not automatically shared/moved later.

How to create a pool lead

1. Use a fresh browser session and unique test identity. Submit a home page, Contact Us or other general form; alternatively identify yourself in AI chat.
2. In Super Admin > Website Leads > Pool, search by the exact test email/name. Confirm it appears with its source and no routed destination.
3. Continue using the same browser identity so property views attach to this website lead. Sign-in/contact identity must match.

Test routing and verify results

Automatic routing test cases

Case	Test steps	Expected result
Same listing twice	Create a general-form pool lead. Visit one owned test property. Wait 30+ minutes, then revisit that same listing.	After the second qualifying visit, lead moves from Pool to Routed and appears in that property owner's CRM. Routing reason indicates repeated listing interest.
Same agent, two listings	Use two properties assigned to the same test agent. Visit each once, with visits counted separately.	Second qualifying visit routes to that agent's account (or associated agency account) and the normal property assignment picks the agent.
Same agency, two listings	Use two properties owned by the same test agency but different agents; visit each once.	Second qualifying visit routes to the agency. CRM lead assignment follows the agency's normal rules and eligible agent/property relation.
Below threshold / refresh	Visit one listing once; reload/reopen within 30 minutes. Check pool status.	Still Pool: same-listing views inside 30 minutes count as one qualifying visit. No premature route.
Property detail enquiry	Submit Contact Agent/enquiry form directly from a known property page.	Direct CRM lead is created for that property's linked agency/agent. Verify in that account's CRM Leads, not only the pool.

Super Admin workflow

1. Open Website Leads; inspect Pool, Routed and All counts. Search by name/email/phone and filter by source.
2. Open the test visitor. Check first/last active, engagement insights, most interested properties and Routed To entries. Confirm routing reason/destination after threshold.
3. For a lead still in Pool, select the test record, choose an approved active agency/agent and optional note, then Transfer only if testing manual routing.
4. Verify it appears under Routed and in the destination CRM Leads with identity, activity/property context and note. Check direct partner login cannot access Website Leads.

Expected results

- [ ] General form/chat lead first appears in Super Admin Pool; property-specific enquiry goes directly to listing CRM.
- [ ] Two qualifying visits to same listing, same agent's inventory or same agency inventory trigger the appropriate automatic route.
- [ ] Same-listing refresh/revisit inside 30 minutes does not falsely count as two visits.
- [ ] Routed record leaves Pool; destination CRM shows correct account and normal agent assignment.
- [ ] Website lead identity/activity is not mixed across contacts or browser sessions.

Test notes

Record source form/chat, test identity, visitor ID, listing IDs, owner/agent/agency of each listing, visit timestamps (prove 30-minute separation), pool/routed state and destination CRM lead ID. Use test accounts and properties only. Manual transfer changes routing and can notify the destination; do not use real visitor records.
