Master Data: Lead Stages, Tags and Sources

Understand shared options, account-owned options and how they help organize leads

Purpose: Master Data provides consistent choices used to classify and filter CRM leads. It has Stage, Tag and Source sections. Super Admin manages global MW Realty values; partner users can use those shared values but cannot edit/delete them.

What each value means

Value	Meaning and use	Example
Stage	Lead's current position/status in the follow-up or sales pipeline. Changing stage helps show progress and filter work. Some stages can be marked closed and affect won/lost reporting.	New, Contacted, Viewing, Negotiation, Closed
Tag	Extra descriptive label for grouping/priority/type. A lead may have multiple tags; tags do not replace the stage.	Buyer, Seller, Hot Lead, VIP, Follow Up
Source	Where/how the lead came from. Helps compare channels and filter leads by origin.	Website, Referral, Property Portal, Social Media

Shared vs account-owned values

1. **Super Admin creates a shared value.** A global Stage, Tag or Source is available across agency and agent CRM accounts. Partner users can select it on leads and use it in filters, but the row is marked MW Realty / View only; edit and delete are unavailable to them.

2. **Agency creates its own value.** A custom value created in the agency's Master section belongs to that account. It is available for that account's lead workflow and authorized team use; other agencies cannot see or use it.

3. **Agent-created value.** A custom value created by an Agent is scoped to that agent's own account. Verify visibility using that agent and another account; it should not become a global shared value.

System sources: Website/form and other system-generated source names are provided as shared values so captured leads can be classified consistently. A new non-system/custom source used for an agency lead should be created in that agency's scope.

Tester workflow and expected results

Role-based test workflow

1. As Super Admin, open Master > Stage, Tag and Source. Review global rows, names, colors/order, default/closed indicators where shown, and lead counts.
2. Create one clearly named disposable test Stage, Tag and Source. Verify save, selector availability on a test lead, search/order and lead count.
3. Sign in as Agency. Confirm global MW Realty rows are visible and usable, but show View only; try normal UI controls and (if authorized) confirm direct edit/delete of a global row is denied.
4. As Agency, create an agency-specific Stage, Tag and Source. Use them on a test lead. Confirm they appear for the agency's own lead workflow and are not available to an unrelated agency.
5. Sign in as an authorized Agent in the agency team. Verify which agency-owned values are visible/usable per account access. If Agent can create own values, confirm they remain scoped to that agent and do not alter global or other-account lists.
6. In Leads, apply stage/tag/source filters and confirm the expected test lead is returned. Reopen the lead and check its classification remains after refresh.

Expected results

- [ ] Global values created by Super Admin are visible and selectable across permitted partner accounts.
- [ ] Agency/Agent users cannot edit, reorder or delete Super Admin global values.
- [ ] Custom values created by a partner are scoped to that owner/account and do not leak to unrelated accounts.
- [ ] Stage describes pipeline status; Tag labels extra lead attributes; Source identifies lead origin.
- [ ] Lead list filters by stage, tag and source return matching records and clear correctly.
- [ ] Values already used by leads cannot be deleted until removed from linked leads; default stage protections apply.

Use values to classify a new lead

When a lead arrives from a new channel, create a custom Source in the owning agency/agent's Master section (unless it is a system source supplied globally). Choose that Source on the lead so the owner can filter and report on that origin. Set a Stage to show current follow-up status; apply one or more Tags for additional grouping. Repeat with both shared and account-owned values to check scope.

Safe testing / bug report

Use disposable master values and test leads. Record role, account, value name/type, lead ID, where created, which users can see/use it, exact steps and expected vs actual. Avoid editing shared production classifications: a global value affects every account.

> **Key distinction:** Stage = where the lead is in the process. Tag = what extra label describes it. Source = where the lead came from. These classifications make lead lists easier to understand, search and filter.
