Integrations

Connect Facebook Lead Ads and Property Finder; test sync and imported records

Access: Approved account with the relevant plan feature enabled. Agency/Agent can manage their own connection. Super Admin can review/manage connected account mappings and Property Finder listings awaiting review. Use sandbox/test credentials and pages only.

Facebook Lead Ads - what it does

Connect a Facebook account that manages a Page, choose the Page and link it to the correct MW Realty agency or independent agent. The Page subscribes to lead notifications. New submissions from Facebook Lead Ads forms arrive automatically in that connected account's CRM Leads. Existing submissions can also be fetched when connecting; sync actions catch up or re-check leads.

Facebook tester workflow

1. Open Integrations > Facebook. Select Continue/Connect Page, sign in with a test Facebook user that administers the test Page and approve the requested access.
2. Select the test Page. Super Admin chooses the intended account for each Page; Agency/Agent connects it to their own account. Confirm a Page already connected to another account is shown as blocked and not duplicated.
3. At connection, test the existing-leads import option: choose a date window (7/30/90 days or All) or skip. Wait for background import progress and completion summary.
4. Submit a new test Lead Ad form (or use an approved Meta test-lead action). Confirm the new lead appears automatically in the connected account's CRM Leads. Check source/ad set, campaign/ad/form attribution and assignment.
5. Test Sync now (recent leads since last sync) and All leads (all-time fetch) on the connected Page. Review added/skipped/import status and lead records.

Duplicate behavior: Facebook lead IDs import once. A repeat submission/person may merge into an existing lead for that account rather than create a duplicate. Sync is background work; wait for status to finish. A Page can feed one account only.

Facebook expected results

- [ ] Connected Page and linked account are correct; status/token health is visible.
- [ ] Existing import respects selected date range; skipped/merged/new totals are reported.
- [ ] New test ad lead arrives automatically after Page webhook delivery and is searchable in CRM Leads.
- [ ] Campaign/ad set/ad/form attribution and source are retained; duplicates are not cloned.
- [ ] Sync now catches recent missed records; All leads rechecks all Page forms without duplicating existing leads.

Property Finder sync

Agency or independent Agent connects using its Property Finder API key and secret. Connecting verifies and stores the credentials; it does not itself import listings. Start a sync manually when ready. Imported listings wait for Super Admin review before they can go live.

Property Finder tester workflow

1. Open Integrations > Property Finder as the account that owns the test credentials. Enter the test API key and secret and choose Verify & connect.
2. Confirm valid credentials connect and display a masked key/status. Try invalid credentials only with a safe test credential; expect a clear verification error and no connection.
3. For a first sync, choose Import all listings. The job runs in the background; check progress and wait for added/skipped/failed totals.
4. After a successful full sync, add a test listing in Property Finder and choose Sync new listings. Confirm only listings since last sync are checked.
5. Use Re-check all to test a full re-scan. Duplicates/already imported listings should be skipped. Super Admin opens Property Finder review and checks imported listings in pending/review queue, then approves/rejects test records if authorized.
6. Test agency Agent access to the agency connection/sync where allowed. Disconnect only a test account; confirm imported property records remain in Properties.

Property Finder expected results

- [ ] Credential validation succeeds only for accepted key/secret; secrets remain masked and never appear in screenshots/logs.
- [ ] Connect saves credentials, while Import all / Sync new / Re-check all start the selected background job.
- [ ] Progress and result show added, already present/skipped, failed and error details.
- [ ] New imported properties enter review and do not publish publicly before Super Admin approval.
- [ ] Re-sync does not duplicate records; disconnect stops future sync but keeps already imported listings.

General test notes

Record provider, account, Page/property IDs, selected sync mode/date range, job status, result counts and sample CRM lead/property IDs. Check plan access, credentials, provider webhook and worker status before reporting a sync defect. Use only test Pages, listings and accounts. Never disclose API secrets or trigger live campaigns/payments.

> **Key difference:** Facebook new lead submissions are event-driven after Page connection; historical/catch-up lead sync is also available. Property Finder connection only verifies credentials; a user must start the property import/sync. Both syncs may run in the background.
