Properties

Create, verify, approve, publish and manage residential listings

Purpose: Properties is the residential listing workspace. Agency/Agent users create and maintain their listings; the public website displays eligible listings after required permit verification and Super Admin approval.

Create a test property and verify DLD permit

1. Open Properties and choose Add Property. Enter disposable test listing details in the required sections: title/description, location, listing type, price, specifications, images and agent/owner as available.
2. In Core Details, choose the relevant permit authority/type and enter the test DLD permit number/details and expiry if required. Use the online DLD Verify action while creating/editing the property.
3. Check verification success/failure feedback. Save the listing and reopen it. Confirm permit number, verification status/method and expiry are preserved. Test invalid/expired permit with approved test data only.
4. Submit for review/save as required. As Super Admin, open Listing Permits/approval queue and approve the eligible test listing. Also check request changes/take-down only with a disposable record.
5. After approval, confirm the listing can be published and appears on the public website with correct details. Before approval, verify it is not publicly live.

Expected: Online DLD verification checks permit details; it does not replace Super Admin listing approval. A listing displays publicly only after required approval and while its permit/status is valid.

Form sections and edit workflow

Open the saved property and edit a safe field. Check available sections/tabs such as Basic/Core details, specifications, amenities, easy access, attributes, gallery/media, agent, nearby places, floor plans and SEO. Save changes and reopen; test validation for required fields, images and permit data. Use preview before publishing.

6. Verify each saved input appears in the correct edit section and public listing display. Confirm assigned agent/agency contact is correct and enquiry routing matches the listing.

Find and assess listings

Filters, grid/list views and quality score

1. Use search and available filters (status/compliance, listing type, location, price, bedrooms or other visible facets). Apply, clear and compare results/counts.

2. Switch Grid and List view. Confirm same filtered records, key listing details, status badges and actions are available in each. Refresh and verify chosen view/filter behavior.

3. Inspect Quality Score on a test property, including its hover/detail breakdown. Fill missing listing content such as photos, description, location/specification and features; save and confirm score/breakdown responds as designed.

Quality score: A completeness/readiness indicator for listing content. It helps identify what could be improved; it is separate from permit verification and Super Admin approval. Do not treat a high score as proof of legal approval.

Listing insights

Open listing details/Insights if available to the account. Review impressions (how often the listing card/page was shown) and listing clicks (visits/openings of the listing detail), plus date range or trend indicators shown. Compare after viewing the public site or using a test session; counts may update after tracking/report refresh. Verify the metrics belong to the selected listing and date filter.

Expected results

- [ ] Search and filters find expected records; clearing restores the list.
- [ ] Grid and List show consistent records/status and open the same property detail.
- [ ] Quality score and breakdown reflect completeness fields; permit/approval state is independently shown.
- [ ] Listing insights show impressions and clicks for the correct listing/date range; empty data uses a clear zero/empty state.

Premium / featured promotion

Premium is a paid or plan-entitled promotion that displays a badge and places the property in the website Premium section. From Properties/Premium, select an eligible listing and review the feature dates and payment method before confirming.

4. Use a sandbox/test listing. Check plan Premium quota/allowance or choose credit payment if offered. Review the credit cost, available balance, start date and end date/duration.

5. Confirm promotion, then check Live/Scheduled status, dates, listing badge and public Premium placement. Change dates or stop/cancel the disposable feature and verify behavior.

Expected: Promotion starts or schedules according to its start date, uses the selected plan allowance/credits and stops at the end date (unless no end date was selected). Live removal drops badge/placement; cancel a scheduled feature to release its booking. Never spend live credits without authorization.

Mark as sold and verify end state

Sold marking workflow

1. Choose a disposable active test property and click Mark as Sold (or rented where applicable).
2. Link an existing test buyer lead or enter a new test buyer. Enter sale price/date and other requested deal details. Upload required test ownership/title document and sale contract/Form F or MOU using non-sensitive sample files.
3. Submit, then check Sold Listings, the linked buyer lead and relevant sales report. Confirm property is removed from public active listings and the buyer lead is moved to the won stage.
4. If the workflow permits, revert the test sold record and confirm active state and linked data are restored as designed.

Expected results

- [ ] Sold property moves to Sold Listings and is taken off the public website.
- [ ] Sale date/price, buyer lead, documents and notes are saved; required files are validated.
- [ ] Linked buyer lead is marked won/closed according to the system workflow.
- [ ] Sold values appear in reports; revert restores the listing when supported.
- [ ] Sold property cannot be accidentally reactivated while still marked sold.

Complete tester checklist

- [ ] DLD permit verification works and its status is saved separately from admin approval.
- [ ] Super Admin approval controls whether an eligible listing can go live.
- [ ] Create/edit inputs, images and sections save and display correctly.
- [ ] Filters, grid/list views, quality score, impressions/clicks, Premium dates/payment and sold lifecycle work.

Safe test notes / bug report

Use test properties, test permits, test buyer contacts and sample documents only. Record role/account, property ID, permit verification result, approval state, view/filter, quality breakdown, Premium plan/credit method and dates, insight date range, sold lead ID, exact steps, expected vs actual and screenshot. Mask personal/permit/document data. Avoid publishing real listings or making live payments.
