Advertisements

Module purpose, hands-on test workflow and expected results

Access: Manage paid advertising placements/campaigns associated with listings or account inventory, subject to available plan and setup.

What this module does

Manage paid advertising placements/campaigns associated with listings or account inventory, subject to available plan and setup.

Tester workflow

1. Open Advertisements and inspect campaign/listing table, status, spend or credit labels, and available actions.
2. Start a test/draft advertisement for a disposable listing if a sandbox is available.
3. Review targeting, duration, preview and confirmation before submit.
4. Check resulting status/report; stop only a test campaign..

Expected results

- [ ] Draft/active/paused status and listing association are correct; preview and validation are clear.
- [ ] Any billing/credit consumption is disclosed and matches the test action.
- [ ] No campaign should go live without explicit test authorization..

Test notes

Bug report: Include module, role/account/plan, test record ID, exact steps, expected vs actual result, timestamp and screenshot. Use test data only; mask personal data and do not perform live billing, publishing, destructive, or external integration actions without authorization.
