Security

Module purpose, hands-on test workflow and expected results

Access: Manage authentication safeguards such as password changes and active sessions where available.

What this module does

Manage authentication safeguards such as password changes and active sessions where available.

Tester workflow

1. Open Security and review available controls.
2. On a dedicated test account, test password validation and change flow; verify login with new credentials and rejection of old credentials if the workflow requires it.
3. Review session/device controls and revoke only a disposable session..

Expected results

- [ ] Password requirements and confirmation errors are clear; credentials update securely and account can sign in again.
- [ ] Session revocation affects the selected session as expected.
- [ ] Never test with shared/production credentials or include passwords in evidence..

Test notes

Bug report: Include module, role/account/plan, test record ID, exact steps, expected vs actual result, timestamp and screenshot. Use test data only; mask personal data and do not perform live billing, publishing, destructive, or external integration actions without authorization.
