Help Desk

Module purpose, hands-on test workflow and expected results

> **Access:** Create and track support requests between the account and platform support team.

What this module does

Create and track support requests between the account and platform support team.

Tester workflow

1. Open Help Desk and review ticket list/status/search.
2. Create a test ticket with a clear subject/category and non-sensitive description.
3. Open it, add a reply or attachment if supported, then inspect status and history.
4. Test closing/reopening only on the test ticket..

Expected results

- [ ] Ticket appears under correct account with readable status, timestamp and message history.
- [ ] Replies/attachments persist and are visible to permitted users.
- [ ] Required fields and attachment limits are clear.
- [ ] Do not include passwords or private customer information..

Test notes

> **Bug report:** Include module, role/account/plan, test record ID, exact steps, expected vs actual result, timestamp and screenshot. Use test data only; mask personal data and do not perform live billing, publishing, destructive, or external integration actions without authorization.
